DNA vaccine containing plasmid and cationic lipid containing quaternary ammonium salt, useful for protecting pets and sports animals against, e.g. herpes virus.

Example 10; Fig 26; 109pp; French.

The invention relates to a novel DNA vaccine against pathogens that affect pets and sports animals comprises a plasmid containing a sequence, expressible in vivo, that encodes an immunogen from the relevant pathogen and a cationic lipid containing a quaternary ammonium salt, particularly N-(2-hydroxyethyl)-N,N-dimethyl-2,3-bis(tetradecyloxy)-1-propanammonium (DMRIE). The immunogens are particularly taken from canine distemper

virus (CDV), canine parainfluenza virus type 2 (CPI-2), canine herpes virus (CHV), feline herpes virus type 1 (EHV-1), equine herpes virus type 1 (EHV-1), and EHV type 4 (EHV-4). The method may also include the use of a immunogenic stimulation factor especially a granulocyte-macrophage colony stimulation factor especially a granulocyte-macrophage colony stimulation factor (GM-CSF) to enhance the immunogenic response. The vaccines, which may be multivalent, are particularly used to protect dogs, cats and horses against bacterial and viral diseases, particularly those caused by the Paramyxoviridae. Formulations with the quaternary protection, particularly when administered subcutaneously. This sequence represents an equine GM-CSF used in the invention
                                                                                                                                                                                                                                                                                                                                                                     9

This sequence represents a horse granulocyte-macrophage colony stimulating factor (GM-CSF). The corresponding gene was isolated from horse lymphocytes using a reverse transcriptase PCR method with primers AAPZ8954-AAFZ8950. The protein has been shown to have at least 75%

```
colony formation in various types of blood cells and particularly induces colony formation in various types of blood cells and particularly induces colony formation in various types of blood cells and particularly induces and causes recruitment of leucocytes to sites of inflammation. Vectors containing the gene or the protein itself, are useful as adjuvants in immunogenic or vaccinating compositions for horses, e.g. for protection against equine herpes, tetanus, Borrelia burgdorferi, rabies etc. Also as non-specific stimulators of the immune system. In a specific example, containing the sequence for equine GM-CSF was used to transform CHO-KI cells and the transformants grown for 48 hours. The culture supernatant was then added to culture medium being used to grow containe bone marrow cells. After 14 days, the mean number of colonies per culture box was 12-15, compared with none for cells grown in absence of GM-CSF. Equine GM-CSF allows a reduction in the amount of immunogenic/vecinating component required, and may induce a response in

The sequence is that of a porcine cytckine designated chimerism enhancing factor (CHEF-2). The cytokine can be used for improving engrafment, stabilisation and proliferation of tissues, esp. bane marrow cells, in xenogeneic transplantation. The cytokine may be used to prevent or treat various swine diseases, e.g. African swine fever, Hog cholera, pseudorabies, etc. See also AASTS4817-9. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                 The sequence is that of the ovine granulocyte-macrophage colony stimulating factor (GM-CSF), a cytckine-like molecule. The ovine cytckines will be useful in the intensive livestock industries such as live animal export trade, feed-lots and intensive rearing industries, where animals are subjected to great environmental challenge with infectious diseases, partic. respiratory infections, and are more prone to immunodepressive effects. The cytckines may be used for treatment or prophylaxis to maintain, stimulate or enhance immunoresponsiveness. They may also be useful as natural adjuvants for vaccines for sheep and cattle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A recombinant DNA molecule encoding a hGM-CSF is claimed wherein there is a 5' terminal alteration allowing higher yield than the native DNA sequence. The cpds. may be used to reduce the likelihood of infections in immunologically compromised individuals, such as those suffering from AIDS by increasing their white blood cell count
                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                         Sequence of a human granulocyte-macrophage colony stimulating factor (hGM-CSF)-like polypeptide isolated from 5637 cell line.
                                                                                                                                                                                                 9
                                                                                                                                                               9
administration to enhance natural defences against neoplastic and infectious diseases or as an adjunct in chemotherapy to overcome myelosuppression. GM-CSF is prepared by conventional recombinant DNA techniques. The factor has activity on human neutrophilic granulocytes, macrophages and eosinophils. (Updated on 25-MAR-2003 to correct PF field.)

This sequence represents human granulocyte-macrophage colony stimulating factor (GM-CSF). Heterogeneity of the nucleotide sequence and the amino acid sequence has been observed and this sequence as deposited in E. coli as ATCC 19923. The GM-CSF protein was isolated using the method of the invention. The method comprises killing and disrupting GM-CSF-expressing bacteria and preparing a GM-CSF containing extract from the disrupted cells. This extract is subjected to quaternary amino ethyl (QAE) anion exchange chromatography to separate proteases and produce protease-free GM-CSF fractions. These fractions are subjected to red 120 triazinyl dyeligation affinity chromatography to obtain GM-CSF containing fractions. Free of hydrophobic impurities. These fractions are then subjected to gel filtration column chromatography to produce GM-CSF containing fractions free of high and low mol. Wt. impurities which are then subjected to gel free of high and low mol. Wt. impurities which are then subjected to gel reversed-phase column chromatography to produce fractions with a purity of greater than 95%. The obtained GM-CSF may be used in clinical situations where the stimulation of blood cell generation is desirable.
                                                                                                                                                                                                         Human; granulocyte-macrophage colony stimulating factor; GM-CSF; E.coli; quaternary amino ethyl anion exchange chromatography; red 120 triazinyl dye-ligand affinity chromatograph; gel filtration column chromatography; stimulation; blood cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    anion-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Purifying granulocyte-macrophage colony-stimulating factor - by eexchange, dye-ligand affinity, gel filtration and reversed-phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         77.2%; Score 586; DB 2; Length 144; 76.4%; Pred. The muteins are useful in the screening of cytokine and cytokine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative

                                                                                                                                                                                                                                                                                                                                                                                   This represents the human granulocyte macrophage colony stimulating factor (GM-CSF). A murine GM-CSF which is similar to the human GM-CSF is used for generating a recombinant poxvirus. The recombinant poxvirus comprises a nucleic acid sequence encoding a biological response modifier or its immunomodulating fragment in a non-essential region of the recombinant virus genome. The biological response modifier may be a cytokine, e.g. interlekin-12 (II-12), II-2 or GM-CSF. The recombinant poxvirus is used to transfect cells for expression of the biological response modifier. The products are useful for the treatment of tumours or for protecting a host against tumour formation

The present sequence represents part of a human GMCSF protein. It is used to produce fusion proteins with a human zalphall ligand. Zalphall ligand is useful for stimulating the proliferation and development of hematopoietic cells in vitro and in vivo. Zalphall ligand polymucleotides can be used as primers or probes to cloning the zalphall gene. The zalphall ligand is useful for treating tumourigenesis. A zalphall ligand-saporin fusion toxin may be used for treating leukaemias and lymphomas. Antagonists against zalphall ligand are useful as research reagents for characterizing ligand-receptor interaction. Antagonists are also useful for inhibiting expansion, proliferation, activation and differentiation of cells involved in regulating hematopoiesis. The zalphall ligand may also be used to stimulate an immune response against B cell tumour, a virus, a parasite or a bacterium. The zalphall polypeptides, polynucleotides, antagonists, agonists and antibodies are also useful for the detection, diagnosis, prevention, and treatment of diseases associated with a zalphall ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 SETFDABELITCLOTRIKLYKQGLRGSLIKLEGPLTWMASHYKQHCPPTLETSCATQMITF 120

The present sequence is given in a specification relating to polynucleotide and polypeptide molecules for mammalian secreted alpha helical protein-31 (zalpha31). The polypeptides are a novel four-helixx bundle cytokine and may be used to regulate the functioning of the immune system. The polypeptides are used to identify and isolate receptors involved in spermatogenesis, steroidogenesis, testicular differentiation and regulatory control of the hypothalamic-pituitary gonadal axis, thyroid, heart and adrenal function. They are useful for treating disorders of the reproductive system, thyroid, adrenal, heart and immunological systems. Zalpha31 polypeptides, or antagonists are useful in the treatment of e.g. osteoporosis, peget's disease, and hyperparathyroidism, acute pancreatitis and gastrointestinal disorders and as analgesics, especially for bone pain. They can be used to treat atherosclerosis, pelvic inflammatory disease. (PID), psoriasis, atheritis, eczema, scleroderma and other inflammatory disease. The polypeptides, nucleic acids and/or antibodies can be used to treat heart transplantation, treat complications related to poor circulation e.g. diabetic foot ulcers, treat stroke, improve cardiac function, induce skeletal muscle neogenesis and/or hyperplasia, be used in kidney regeneration and/or for treating vistemic and pulmonary characterisminal can be used for treating viral leukaemias, hypertension. Zalpha31 can be used for treating viral leukaemias, effectively immunodeficiency syndrome (AIDS) or gastrointestinal viral
                                                                                                            granulocyte-macrophage colony stimulating factor; GM-CSF; cytostatic; antiinflammatory; antiarthritic; antirheumatoid; immunosuppressive; antiasthmatic; antibacterial; osteopathic; antibacherosclerotic; antipsoriatic; dermatological; anti-HIV; gene therapy; osteoporosis; Paget's disease; hyperparathyroidism; acute panoreatitis; gastrointestinal disorder; inflammation; heart disorder; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel 4-helix bundle cytokine, Zalpha31, useful for regulating the function of immune system and for treating thyroid, adrenal, lymphoid, inflammatory, pancreatic, blood or bone disorders.
                                                                                         Human; zalpha31; alpha helical protein-31;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 107-108; 111pp; English.

```
The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent inhibitor agent inhibitor agent action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound invention are platelet rederived growth factor (PGF), it is blatelet derived growth factor (FGF), connective tissue derived growth factor (CTGF), keratinocyte-derived growth factor (KGF), transforming growth factor-beta (TGF-bera), granulocyte macrophage colony stimulating factor (GM-CSF), epidermal growth factor (GGF), and chrysalin. Inhibitors which are included in the composition of the invention included inhibitors of urokinase-type plasminogen activator (UPA) and matrix metalloproteinase (MMP). The composition is useful for the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers.
                                                                                                                                                                                                                                                     Growth factor; protein inhibitor; protease; damaged tissue; platelet-derived growth factor; PDGF; fibroblast growth factor; FGF; connective tissue derived growth factor; CTGF; chrysalin; VEGF; keratimocyte-derived growth factor; KGF; epidermal growth factor; EGF; transforming growth factor-beta; TGF-bata; matrix metalloproteinase; MMP; granulcoyte macrophage colony stimulating factor; GM-CSF; uPA; dermal ulcer; wound.
                                                                                                                                                                                                                             Amino acid sequence of granulocyte macrophage colony stimulating factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition for the treatment of damaged tissue i.e. chronic wounds and dermal ulcers comprises an inhibitor agent i.e. a protease and a growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                      Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for producing human granulocyte macrophage colony stimulating factor (hGM-CSF), where hGM-CSF having higher activity is easily purified. The method comprises: (a) preparing a fusion gene construct which contains a human origin glycoprotein gene linked with a bladder specific promoter, uroplakin II; (b) microinjecting the fusion gene construct into a fertilised egg; (c) transplanting the egg containing the fusion gene construct (KCTC 0723BP) into a surrogate mother; (d) producing a transformed animal KCTC 0723BP) into a surrogate mother; (d) producing a transformed animal from the surrogate mother; and present inequence represents hGM-CSF which his referred to using the Genbank accession number X03021 in the exemplification of the present invention. N.B. The present is not given in the specification

calphall Ligand and the polymucleotide encoding it. The invention also gives the sequence for the zalphall receptor and the polymucleotide encoding it. The zalphall Ligand polypetide stimulates proliferation of natural killer (NK) cells or NK cell progenitors, the activation of NK cells, proliferation of T-cells, proliferation of B-cells stimulated with anti-control of natural killer (NK) cells or NK cells progenitors, the activation of NK cells, proliferation of B-cells stimulated with anti-control of not or stimulated with anti-control of not or calphall Ligand polypetide is also useful in preparing antibodies. The calphall Ligand polymucleotides can be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence representing human GM-CSF (granulocyte macrophage-colony stimulating factor) polypetide can be used to create fusion proteins containing the next of the next of create fusion proteins containing the next of

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
